

CP-D/CP-DR type
Probe Transmitter
Operation Manual

Read this operation manual before
using this product.

Precautions

Please read this operation manual thoroughly and gain an understanding of the contents before using this product. Carefully store this manual in a convenient location at all times for quick and easy reference.

This product should be handled by a person who has sufficient knowledge and skill in safety use.

Safety is not guaranteed for uses that are not intended or prescribed in this manual.

The contents of this manual are subject to change without notice, due to improvements of performance or functions of the product.

Pictures or figures used in this manual may be different from the actual product.

In this manual, safety precautions are classified under the ranks "Warning" and "Caution".

 Warning	Indicates contents that can cause death or serious bodily harm if handled improperly.
 Caution	Indicating contents that can cause injury to persons or physical damage if handled improperly.

1 Handling Instructions

Warning

Do not connect or disconnect the probe transmitter while the furnace is operating, since it may cause injuries such as burns through outbursts of hot furnace gas. If it is necessary to do so, follow the cautions below:

- Keep away from, or do not look into the opening of the attached portion, since hot furnace gas will erupt from the opening.
- Use heat-resistant gloves, etc., since the temperature around the attached portion will become high.
- Attach the product correctly as described in this manual. Improper sealing at the time of attachment may result in danger or outbursts of hot furnace gas.

Caution

Be careful of the following points when attaching/removing the probe transmitter.

- Attach/remove the probe transmitter with care, since rough handling may damage the internal zirconia sensor.
- When removing from high-temperature places, please pull out the probe transmitter being careful not to apply excessive thermal shock in red-hot areas.
- When cooling the probe transmitter which removed from high-temperature places, please avoid that let the probe transmitter touch the refrigerants such as the forced cooling by fans or the direct floor. The excessive quenching may let a zirconia sensor damage even if superior in heat-resistant impulsiveness.
- Air-cool red-hot areas after removing the product from high-temperature places. Keep the product from touching cooling mediums such as the floor face. Excessive cooling will damage the zirconia sensor, even though the product has superior thermal shock resistance.

Caution

It is recommended that the probe transmitter be inserted into a furnace with a standard air flow. (If impurities get inside the cell while being stored, a redox status may occur inside the cell, resulting in wear of the electrodes or thermocouples.)

2 General Matters

2-1 Introduction

The CP-D/CP-DR type probe transmitter inserts its zirconia sensor directly into the furnace atmosphere of the carburizing furnace (each heat-treating furnace) to measure oxygen partial pressures in the furnace by using the furnace temperature, sets the temperature and CO level conditions, and measures the CP (carbon potential) of the furnace atmosphere.

Conversion into the CP value is carried out by the CPM type carbon potential calculator.

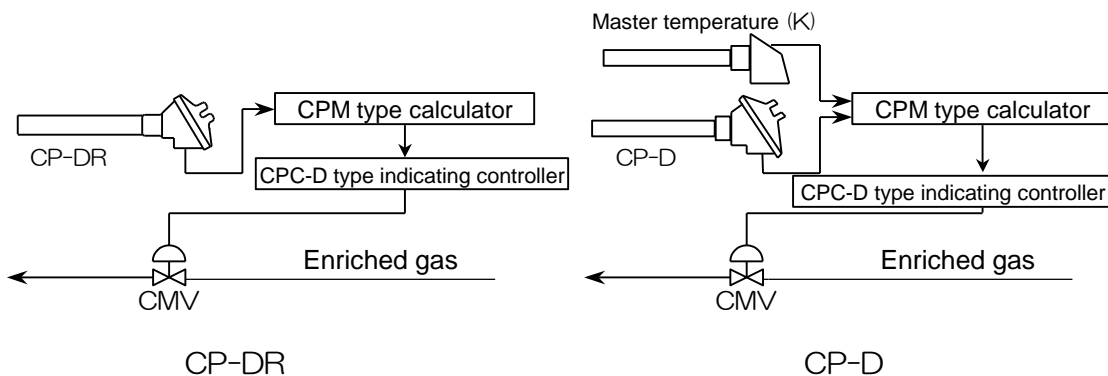

Additionally, the CPC-D type indicating controller is used to control (adjust the additive gas flow rate of) the opening of the control motor valve, etc.

Refer to the operation manual of the separate volumes for the use of the CPM type carbon potential calculator and the CPC-D type indicating controller.

2-2 CP-D and CP-DR Type Probe Transmitter

The R-thermocouple is built into the zirconia sensor of the CP-DR type probe, since temperature measuring is indispensable in reading the CP value directly from the zirconia sensor output.

Only the zirconia sensor is built into the CP-D type probe transmitter, and thermocouples are not built into it; therefore, the master temperature (K-thermocouple) signal is used to directly read the CP value by using the CP-D type probe transmitter.

2-3 Product Warranty

1) Period

One year from the date of purchase

2) Conditions

The Energy Support Corporation shall repair, recall, or exchange the product free of charge if there is any problem or abnormality arising from defects in design, craftsmanship, or materials attributed to the company during the above-stated warranty period, provided that the product is properly stored and installed and all appropriate procedures are followed after purchase. (This warranty does not cover consumable supplies and expendable parts.)

Appropriate procedures shall mean:

- Satisfying the use conditions and installation conditions described in this manual.
- Avoiding excessive mechanical shock or vibration to the transmitter.
- Having consumable supplies replaced.
- Checking and maintaining the analysis equipment operation status.

However, the warranty shall not cover the following cases, even during the applicable warranty period:

- Problems resulting from misuse (operations not described in this manual).
- Problems resulting from repair, modification, or disassembling/cleaning by anyone other than the Energy Support Corporation.
- Problems resulting from any naturally occurring event such as fires (including inductive lightning surges).
- Problems resulting from improper storage (storage in locations subject to high temperatures and high humidity) or improper maintenance (generation of mold, etc.).

3) Coverage

This warranty applies only to products delivered by the Energy Support Corporation. This warranty shall not cover incidental damages resulting from products delivered by the Energy Support Corporation (damage or lost profits of products which are atmosphere-controlled by the product delivered by the Energy Support Corporation or damage or lost profits of the furnace in which the product is installed).

4) Special Notes

Note the following points in order to use the transmitter correctly:

1. Burnout protection should be used in the case of adhesion of soot to the transmitter.
2. Furnace atmosphere should not contain hazardous substances such as Zn, Sn, Pb, P.
3. Furnace atmosphere should not contain halogen compounds (HF, Cl₂, etc.).
4. Instrument readings of the carbon potential sensor display the logical operation, on the conditions that the furnace atmosphere degrades to a complete equilibrium state and the CO level is constant. In other words, it does not directly measure CP values, but calculates and displays CP values by measuring the O₂ partial pressure and carrying out computation. Therefore, there may be deviations from the actual CP values.

<Major causes of deviations>

- Distribution of furnace atmosphere due to differing installation locations.
- Effects of undecomposed enriched gas (remaining methane).^{*1}
- Fluctuations in the CO concentration in the furnace.^{*2}
- Differences between the sensor temperature and the master temperature.

5. Calculation of CP is performed in the austenite range. Note that the instrument readings in the cementite range are estimated values. Additionally, electrodes and protective tubes of the sensor shall be regarded as consumable supplies if the product is used in the cementite range.

- ※1) Deviations may become more significant in a fiber furnace, or when 13A is used as enriched gas.
- ※2) When used in an N₂ or Nx based atmosphere or an oxidizing or carburizing atmosphere, there may be fluctuations.

5) When Using Carburizing Stop-off Coating

In the case that the sensor is used in an atmosphere in which carburizing stop-off coating is used, the sensor should be attached horizontally, so that the sampling vent at the top will be placed vertically. **However, depending on the component that are included in the Carburizing Stop-off Coating, may become abnormal sensor output in a short period of time.**

2-4 Precautions for use

Please handle the probe transmitter with care when attaching/removing, since rough handling will damage the zirconia sensor inside.

It is recommended that the probe transmitter be inserted into a furnace with a standard air flow.

(If impurities get inside the cell while being stored, a redox status may occur inside the cell, causing wear of the electrodes or thermocouples.)

Use the product in the following environment:

Probe transmitter	Installation location	Indoors
	Ambient temperature	-10~120°C
	Ambient humidity	No more than 85% RH
	Attachment direction	Horizontally, or vertically downward
	Vibration	Little
	Corrosive gases/hazardous gases	No
Conversion connector cable (optional)	Installation location	Indoors
	Ambient temperature	-10~80°C When installing the CP-DR cable, make sure that there is no difference in temperature between the connectors (within a difference of 5°C)
	Ambient humidity	No more than 85% RH
	Corrosive gases/hazardous gases	No

Zirconial sensor life may be shortened if corrosive gases or organic gases exist.

Air-cool the probe transmitter after removing it from high temperature places. Keep the transmitter from directly touching cooling mediums such as the floor face. Excessive cooling will damage the zirconia sensor, even though the product has superior thermal shock resistance.

2-5 Product Overview

The product has superior features such as the following:

1) Thermal Shock Resistance

The product can be freely detached from the 960°C furnace into the atmosphere.

2) Removal of Soot from the Electrodes

Soot can be removed from the electrodes by regularly carrying out burnout protection.

3) Temperature Measurement of the Zirconia Sensor (CP-DR Type Only)

R-thermocouples are built into the zirconia sensor of the CP-DR type probe transmitter, allowing for temperature measurements indispensable for direct reading of CP values.

4) No Need for Daily Maintenance

The probe transmitter does not require daily maintenance since it is directly inserted into the furnace (there are no sampling parts).

5) Adjustable Insertion Length of the Probe Transmitter

The location of the furnace wall attachment bracket is adjustable, allowing for measurements from a location close to the product.

2-6 Principle of the Zirconia Sensor

1) Reasons Why Oxygen Partial Pressure can be Measured

Oxygen ions can move around in the crystal structure of stabilized zirconia or partially stabilized zirconia (hereby referred to as zirconia), compounds in which yttria (Y_2O_3) dissolves into zirconia (ZrO_2) at high temperatures (greater than $300^\circ C$). At this time, an oxygen concentration cell comes to exist, generating voltage due to the differing oxygen concentrations (oxygen pressures) of both sides of the zirconia. The oxygen concentration (oxygen pressure) can be measured using the characteristics of this oxygen ion solid electrolyte.

Generally, atmospheric air is introduced to one side of the zirconia as the standard. Furnace atmosphere is introduced to the other side. The electrical potential (E) caused by this will be explained by the following Nernst's equation:

$$E = - \frac{RT}{nF} \ln \left(\frac{P_{O_2^A}}{P_{O_2^S}} \right)$$

However,

R: gas constant	8.3143 (J/mol • K)
T: zirconia temperature	(K)
N: number of ions x valences	4 (since 2 divalent oxygen ions are generated from one oxygen molecule)
F: Faraday constant	9.6487×10^4 (/mol)
$P_{O_2^A}$: oxygen partial pressure in the standard atmospheric air	0.206 (atm)
$P_{O_2^S}$: oxygen partial pressure in the furnace atmosphere	(atm)

Figure 1. Measurement principle diagram of the Zirconia Type O₂ Analyzer

2) Reasons Why CP Values Are Calculated by Measuring Oxygen Pressure

Major equilibrium reactions in the reduction atmosphere furnaces, such as carburizing/quenching furnaces will be explained by the following equations:

Note) (C) is carbon activity.

As described above, reactions occur simultaneously or successively in the furnace, thereby entering into an equilibrium status. If each reaction in the furnace reaches an equilibrium status, the amount of the same element in each equilibrium reaction equation will become the same value, no matter which equilibrium reaction equation is used for calculation. Now, look at equations (1) and (7) from among (1)-(11), and let the equilibrium constants of (1) and (7) be K_{p1} and K_{p2} respectively. From there, we obtain:

$$K_{p1} = \frac{(P_{CO})^2}{(C) \cdot P_{CO_2}} \quad (12)$$

$$K_{p2} = \frac{P_{CO} \cdot (P_{O_2})^{1/2}}{P_{CO_2}} \quad (13)$$

And we obtain the following by eliminating P_{CO_2} from equations (12) and (13):

$$K_{p1} = \frac{(P_{CO})^2 \cdot K_{p2}}{(C) \cdot P_{CO} \cdot (P_{O_2})^{1/2}} = \frac{P_{CO} \cdot K_{p2}}{(C) \cdot (P_{O_2})^{1/2}} \quad (14)$$

Also, we obtain the following by modifying equation (14):

$$(C) = \frac{K_{p2} \cdot P_{CO}}{K_{p1} \cdot (P_{O_2})^{1/2}} \quad (15)$$

When the activity coefficient of carbon activity is 1, then:

$$(C) = \frac{\text{Amount of carbon dissolved in austenite (\%)}}{\text{Amount of saturated carbon in austenite (\%)}} = \frac{A_c}{A_s} \quad (16)$$

And we obtain the following using equations (15) and (16):

$$A_c = A_s \cdot \frac{K_{p_2} \cdot P_{CO}}{K_{p_1} \cdot (P_{O_2})^{1/2}} \quad (17)$$

Furthermore, A_s , the amount of saturated carbon in austenite, and the equilibrium constants K_{p_1} and K_{p_2} can be evaluated as the function of the temperature (T). Therefore, equation (17) will be as follows:

$$A_c = F(T) \cdot \frac{P_{CO}}{(P_{O_2})^{1/2}} \quad (18)$$

In Rx gas based furnaces, the CO level in the furnace is kept constant by the material gas; therefore, the amount of carbon dissolved in austenite A_c can be evaluated if the temperature and the oxygen partial pressure in the furnace P_{O_2} can be measured.

3) Conversion into CP Values

Conversion into CP values is performed through logical operation, based on the conditions that the furnace atmosphere has degraded into a complete equilibrium state and the CO level is kept constant. In other words, it does not directly measure CP values, but indirectly measures CP values by measuring O_2 partial pressures. For this reason, there may be deviations from the actual CP values.

Reference) The relation between CP and sensor output under each gas condition is shown in the supplementary chart.

<Major causes of deviations>

- Distribution of furnace atmosphere due to differing installation locations.
- Effects of undecomposed enriched gas (remaining methane).^{※1}
- Fluctuations in the CO concentration in the furnace.^{※2}
- Differences in the sensor temperature and the master temperature.

※1) Deviations may become more significant in a fiber furnace, or if 13A is used as enriched gas.

※2) In case of employing under the conditions of the N₂ & N_x base or the acid sintered carbon, there are some possibilities to cause the deviations.

2-7 Names and Functions of Each Part

1) Probe Transmitter

Nominal designation	Built-in R-thermocouple	Type	L1	L2	Part number
500	No	CP-D	767	490	KS-164421-A KS-164425-A KS-164429
500	Yes	CP-DR	767	490	KS-164422-A KS-164426-A KS-164430
700	No	CP-D	967	690	KS-164431-A KS-164435-A KS-164439
700	Yes	CP-DR	967	690	KS-164432-A KS-164436-A KS-164440

No.	Name	Function
1	Zirconia sensor	Measures oxygen partial pressures
2	R-thermocouple	Detects temperature inside the furnace (inside the cell) Built only in CP-DR
3	Sample gas inlet	Sample gas inlet or burnout air outlet
4	Furnace wall attachment bracket	A bracket to fix the probe transmitter to the furnace. Insertion length of the probe transmitter is adjustable within the limit of MAX. L2. Wrap with seal tape before attaching.
5	Metal connector	Connects to external wiring Connect external wiring by soldering.
6	Standard air inlet	Inlet for standard air Run 30cc/min. air constantly.
7	Burnout air inlet	Inlet for burnout air Run 2-5L/min. air regularly to remove soot adhering to electrodes. Note) Burnout air is released into the furnace through the sample gas inlet.

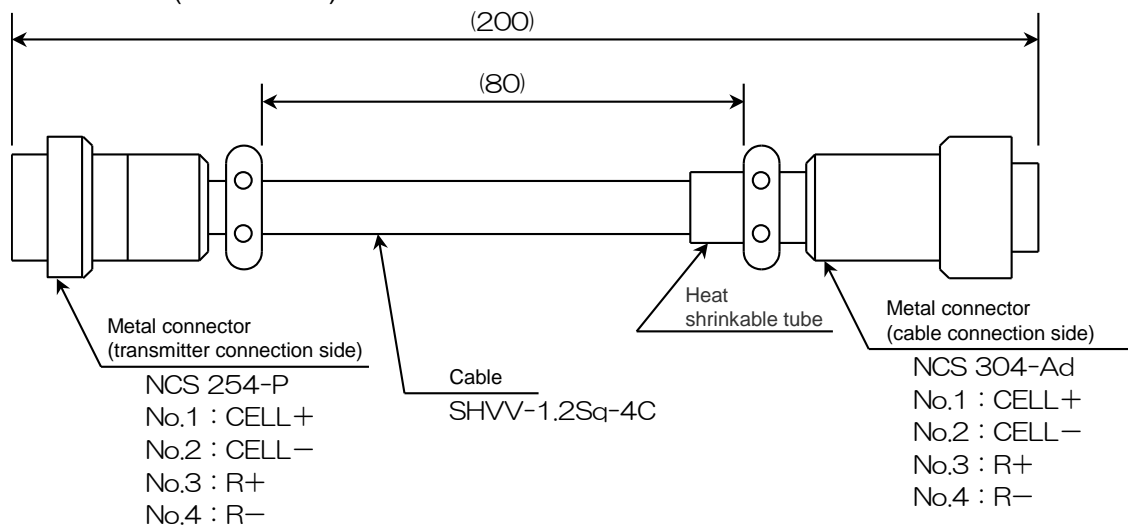

2) Conversion Connector Cable (Optional)

This cable is for maintaining compatibility with the connectors of the existing probe transmitters.

- For CP-D (KS-164441)

- For CP-DR (KS-164442)

Note) Be sure that there is no temperature difference between both connectors since R-compensating lead wire is not used (keep the temperature difference within 5°C).

3 After Opening the Package

3-1 Checking Accessories

<Product and accessories list>

Product name	Part number	Quantity	Note
Probe transmitter	KS-1644**	1	**differs between CP-D and DR and according to length. CP-D-L500 : KS-164421-A KS-164425-A KS-164429 CP-DR-L500 : KS-164422-A KS-164426-A KS-164430 CP-D-L700 : KS-164431-A KS-164435-A KS-164439 CP-DR-L700 : KS-164432-A KS-164436-A KS-164440
Connector	NCS25*-P	1	Accessory *differs between CP-D and DR. In the case of CP-D: NCS-252-P (2P) In the case of CP-DR: NCS-254-P (4P)
Conversion connector cable (optional)	KS-16444*	1	*differs between CP-D and DR. In the case of CP-D: KS-164441 In the case of CP-DR: KS-164442

3-2 Temporary Storage of the Product

When temporarily storing the product, follow the instructions below:

- It is desirable for the product to be stored under the original packaging conditions of the Energy Support Corporation (in a cardboard box with the probe transmitter in a fixed location).
- Keep the product indoors, away from rainwater.
- Keep the product in a location with little change in temperature, with 0-40°C ambient temperature and no more than 85% RH humidity.
- Keep the product in a low-dust location.
- Keep the product in a location with little mechanical vibration.
- Keep the product in a location free from corrosive gases or hazardous gases.

4 Installation

4-1 Installation Conditions

The probe transmitter will be inserted into a section between radiant tubes horizontally, face down from the ceiling or horizontally, from the side. Choose a location where the following conditions are satisfied:

- Measurement target gas is the representative value.
- A location having few sudden changes in gas values. (Do not install the product in a location such as the vicinity of an enriched gas transfer tube, where the transmitter is directly exposed to undecomposed enriched gas directly touching the transmitter.)
- A location having few sudden changes in gas temperature (pressure).
- Gas temperature is between 800°C and 960°C.
- A location having little vibration or shock.
- A location where maintenance can be easily performed.
- A location where outside air temperature (terminal part) remains 120°C or lower.
- A location with no corrosive gases or hazardous gases.
- A low-dust location.

The apical part of the probe transmitter should also be placed as close as possible to the product.

Keep a distance from the product (A) of approximately 50 mm, then take measurements of the furnace interior (L1) and the furnace wall (L2) and decide the measurement of L (L1+ L2 + L3). Choose an attachment location that is not touching piping, etc.

Caution: if the distance from the product (A: approximately 50 mm) is large, the furnace temperature (master temperature) and the CP-DR temperature may not correspond, thus not allowing for accurate CP value calculation. Also, if the temperature of the installation location is low, soot will adhere to the sensor, causing trouble such as abnormal instructions of sensor deterioration, etc.

<Attaching the mount of the probe transmitter>

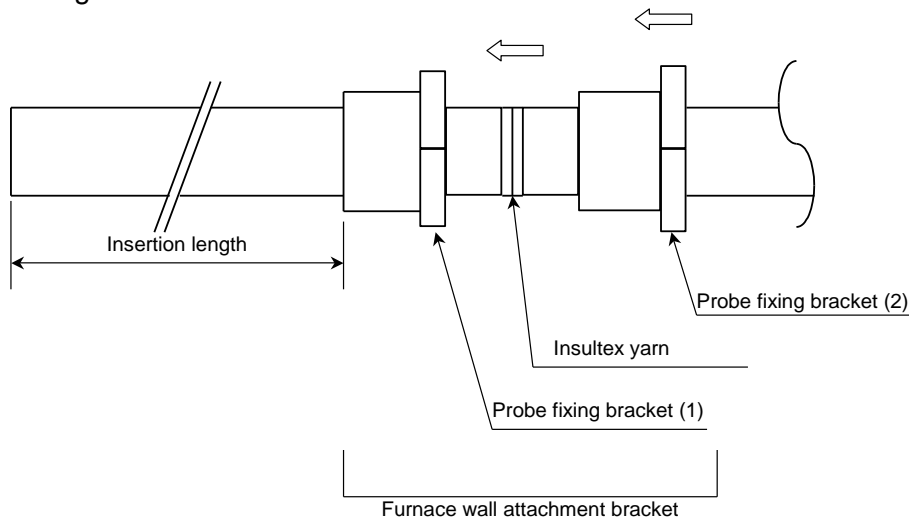

d: More than ϕ 32.

4-2 How to install

1) How to Attach the Probe Transmitter

Wrap the probe fixing bracket (1) of the furnace wall attachment bracket 2 to 3 times with seal tape and attach it to the furnace. The insertion length of the probe transmitter may be adjusted using the furnace wall attachment bracket. Adjust the insertion length to the appropriate length.

To fix and seal, push the Insultex yarn into the probe fixing bracket (1) and screw the probe fixing bracket in.

Maximum insertion length:
L 500; 490 mm, L700; 690 mm

2) Attachment/Removal of the Probe Transmitter

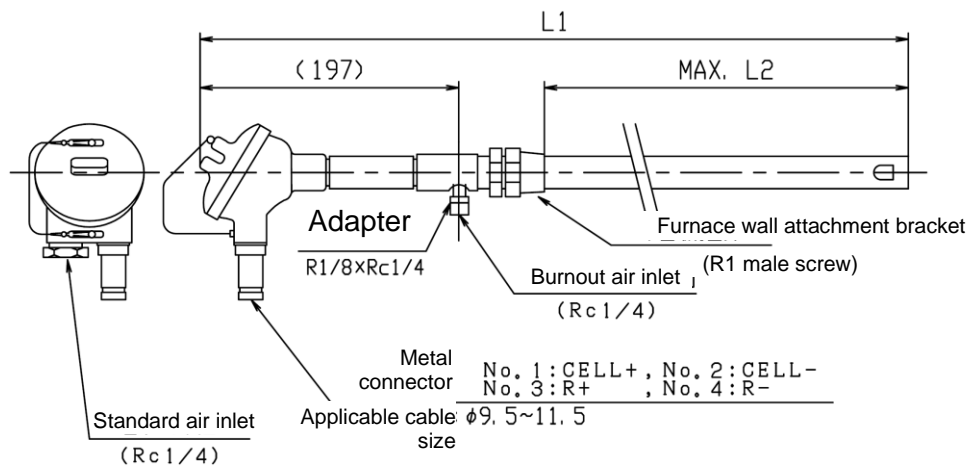

- The zirconia sensor is susceptible to shock. Handle the transmitter with care so as not to hit pipes, etc., when attaching or removing it.
- Be careful of burns, etc., when attaching/removing the transmitter while the furnace is running, since furnace gas will erupt.
- The zirconia sensor made by the Energy Support Corporation has superior thermal shock resistance and can be removed from a furnace with a temperature of 960°C into the outside atmosphere or can be attached to a furnace from the outside atmosphere without restrictions. However, if it is removed from high temperatures, air-cool the red-hot area as described in the figure below. (Do not directly touch cooling mediums such as the floor

face. Excessive cooling may cause damage to the zirconia sensor, even though it has superior thermal shock resistance. Note that the sensor is especially susceptible to water droplet adherence.)

- If the transmitter is attached to a furnace in operation, 30 to 60 minutes will be required for the temperature of the transmitter to stabilize. Note that the output may fluctuate or show abnormal values during this period.

Piping/Wiring Configuration

3) Piping

Burnout air	<p>Burnout protection should be performed regularly on the sensor.</p> <p>Batch furnace : supply air from the insertion of processing materials (work) until the temperature recovers (approximately 800°C).</p> <p>Continuous furnace : supply air once a week, for approximately 10 minutes.</p> <p>Air supply quantity : supply a quantity that brings the sensor output down to 100 mV or lower. (Approximately 2-5 L/min.)</p> <p>Note) Sensor output may not become lower than 100 mV if the sensor is located in the vicinity of a fan. Under such circumstances, make 800 mV the target. In this case, stop the fan of the furnace once a week and check if the output shows 100 mV or lower, to make sure that burnout protection is working.</p>
Standard air	Constantly supply 30 cc/min. (supply drained air)
Pipe material	Control Copper Tube $\phi 6/4 \sim \phi 10/8$ or Teflon Tube $\phi 6/4 \sim \phi 10/8$ Onetouch joints will allow for easy attachment/removal of piping when attaching or removing the probe transmitter.

4) Wiring

Connector pin No.	(1)	(2)	(3)	(4)
CP-D	Sensor +	Sensor -	/	
CP-DR	Sensor +	Sensor -	R-thermocouple +	R-thermocouple -
Wiring material	Ambient temperature: -10~60°C; CVVS ~80°C; HCVVS ~150°C; KGB		R-compensating lead wire Ambient temperature: ~80°C; RX-GS ~150°C; RX-HS	

Note) Output impedance of the sensor is several tens K Ω . Therefore, make sure that the total input impedance of the instrument connected to the sensor is greater than 10 M Ω .

5) How to Connect the Cable to the Metal Connector

[Order]

- 1) Remove (4) to take out (6).
- 2) Loosen (1) so that the cable can enter.
- 3) Perform appropriate end treatment on the cable and pass it through (3).
- 4) Solder the conductors of the cable to (5).
- 5) Screw (3) onto (6), match the tap location, and screw in (4) to fix it.
- 6) Tighten (1) sufficiently to fix the cable.

Applicable cable size: $\Phi 9.5 \sim 11.5\%$

Applicable cable size when using the optional conversion connector cable: $\Phi 11 \sim 13$

6) Pre-operation Inspection

Confirm that the piping and wiring is installed correctly, and measure the insulation resistance between the terminals.

Between sensor+ and the case	100 k Ω or higher (DC500V)
Between R- thermocouple and the case	100 k Ω or higher (DC500V)
Between sensor+ and R- thermocouple+	100 k Ω or higher (DC500V)

4-3 Inspection after Installation

<Cross-checking transmitter output>

Conduct a cross-check of the furnace atmosphere under all operation conditions after installing the transmitter

Use the Resistance Carbon Potential Sensor (Hot wire), CO₂ sensor, or DP sensor to conduct cross checking.

The output value of the transmitter will have some draft due to causes such as deterioration of electrodes or soot adherence. There also exist some differences among transmitters. The above stated cross check value will allow for adjustments when correcting such draft or differences.

Reference) The supplementary chart shows relations between carbon potential and CO₂/DP values under each gas condition.

5 Maintenance

5-1 Daily Check

- Check that the standard air is running at 30~50 cc/min. (Once a day.)
- Check that there are no abnormalities in instrument readings or the operational gas flow rate (valve-opening), as compared to normal values. (Once a day.)
- Conduct a cross check of the instrument readings to confirm that the values are within $\pm 0.05\%C$ of the default value of the CP conversion value. (Once every 2 weeks.)
Note) If a value exceeds $\pm 0.05\%C$, correct the setting value, etc., so that the cross check value will be within $\pm 0.05\%C$. Additionally, if the correction value is greater than $\pm 0.15\%C$ of the default value, see Trouble Shooting for resolutions. Corrections can be made using the CPM type carbon potential calculator.
- Conduct burnout protection on the transmitter (when the furnace temperature is 750°C or higher) and check that the output value is 100 mV or smaller, using the digital voltmeter. (Once every 2 weeks.)

5-2 Regular Check

1. Soot adhering to the inside and the electrode of the transmitter is removable through the performing of burnout protection on the transmitter; however, soot adhering to the outside cannot be removed. If a large amount of soot adheres to the outside of the transmitter, the soot will cause the output to become high (less carburizing). In such a case, conduct burnout protection on the transmitter entirely within a high temperature (750~960°C) oxidizing atmosphere to remove the soot adhering to the outside.
Note) Never expose the transmitter to rapid heating by burners, etc. It will cause damage to the transmitter.
2. When using the transmitter in a furnace where a large amount of carburizing stop-off coating is used, adherence of the coating to the heat insulator (Kao wool) placed at the end slit part of the transmitter will weaken the output responsiveness and lower the output (excessive carburizing). In such cases, remove the heat insulator and replace with a new heat insulator.
 - Use 1 g of heat insulator (Kao wool).
 - Replace the heat insulator when the sensor temperature drops below 100°C.
 - Generally, the heat insulator does not need to be replaced.
3. The zirconia sensor output may be weakened from damage caused by excessive thermal shock, mechanical shock, etc. (excessive carburizing). Follow the steps below for inspection.
 1. Manually operate the (furnace) atmosphere and measure the output between pins 1 and 2 of the metal connectors of the transmitter (measurement value 1).
 2. Next, stop the standard air and measure the output, as above, 5 minutes later (measurement value 2).
 3. If (measurement 1) - (measurement 2) is 10 mV or greater, the zirconia sensor is damaged; replace the transmitter.
Note) See Trouble Shooting for solutions if it is less than 10 mV.
Note) Measure the output using a voltmeter with an input impedance greater than 10 MΩ.

4. The degree of the transmitter's electrodes can easily be checked by measuring the output impedance of the transmitter. Follow the steps below to check:

1. Manually operate the (furnace) atmosphere and measure the output of the transmitter between pins 1 and 2 of the metal connector (voltage 1).
2. Next, measure the output between pins 1 and 2, with the known resistance (resistance value R) connected parallel (voltage 2).
3. Calculate the output impedance (Z) of the transmitter from the results, using the following equation:

$$Z = (\text{voltage 1} - \text{voltage 2}) \times R / \text{voltage 2}$$

If the value of Z is 100 kΩ or greater, the electrodes have reached the end of their lifespan; replace the transmitter.

Note) Measure the output using a voltmeter with an input impedance of 10 MΩ or greater.

Note) Use a known resistance of 50~1000 K.

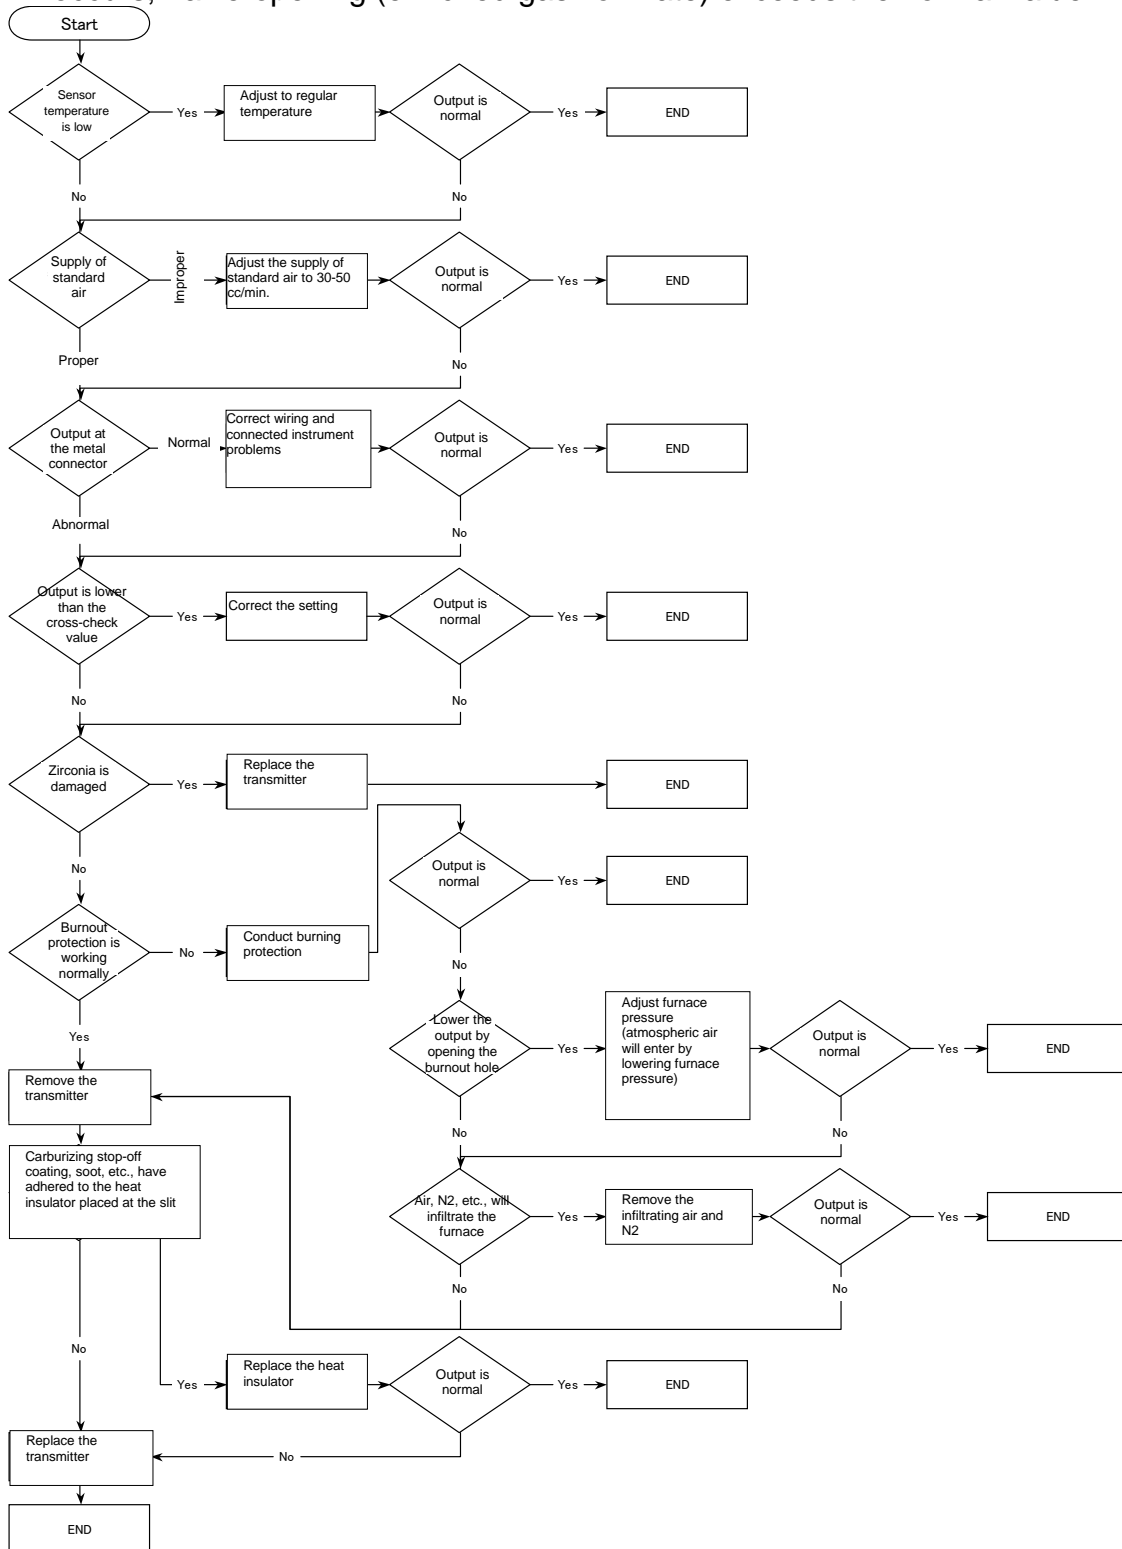

Note) Although the output impedance of the transmitter changes according to temperature, it is normally several kΩ below 930°C and several tens kΩ below 850°C.

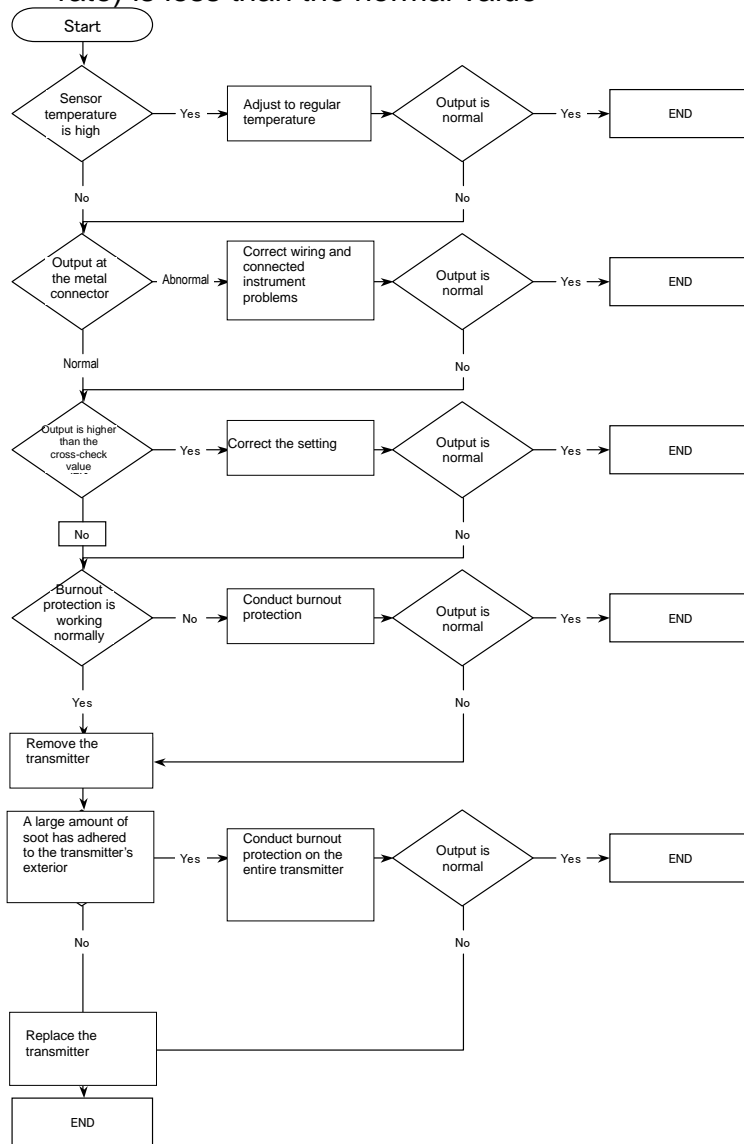

5-3 Trouble Shooting

Use the following trouble shooting tips as solutions if problems occur while using the Carbon Potential Sensor.

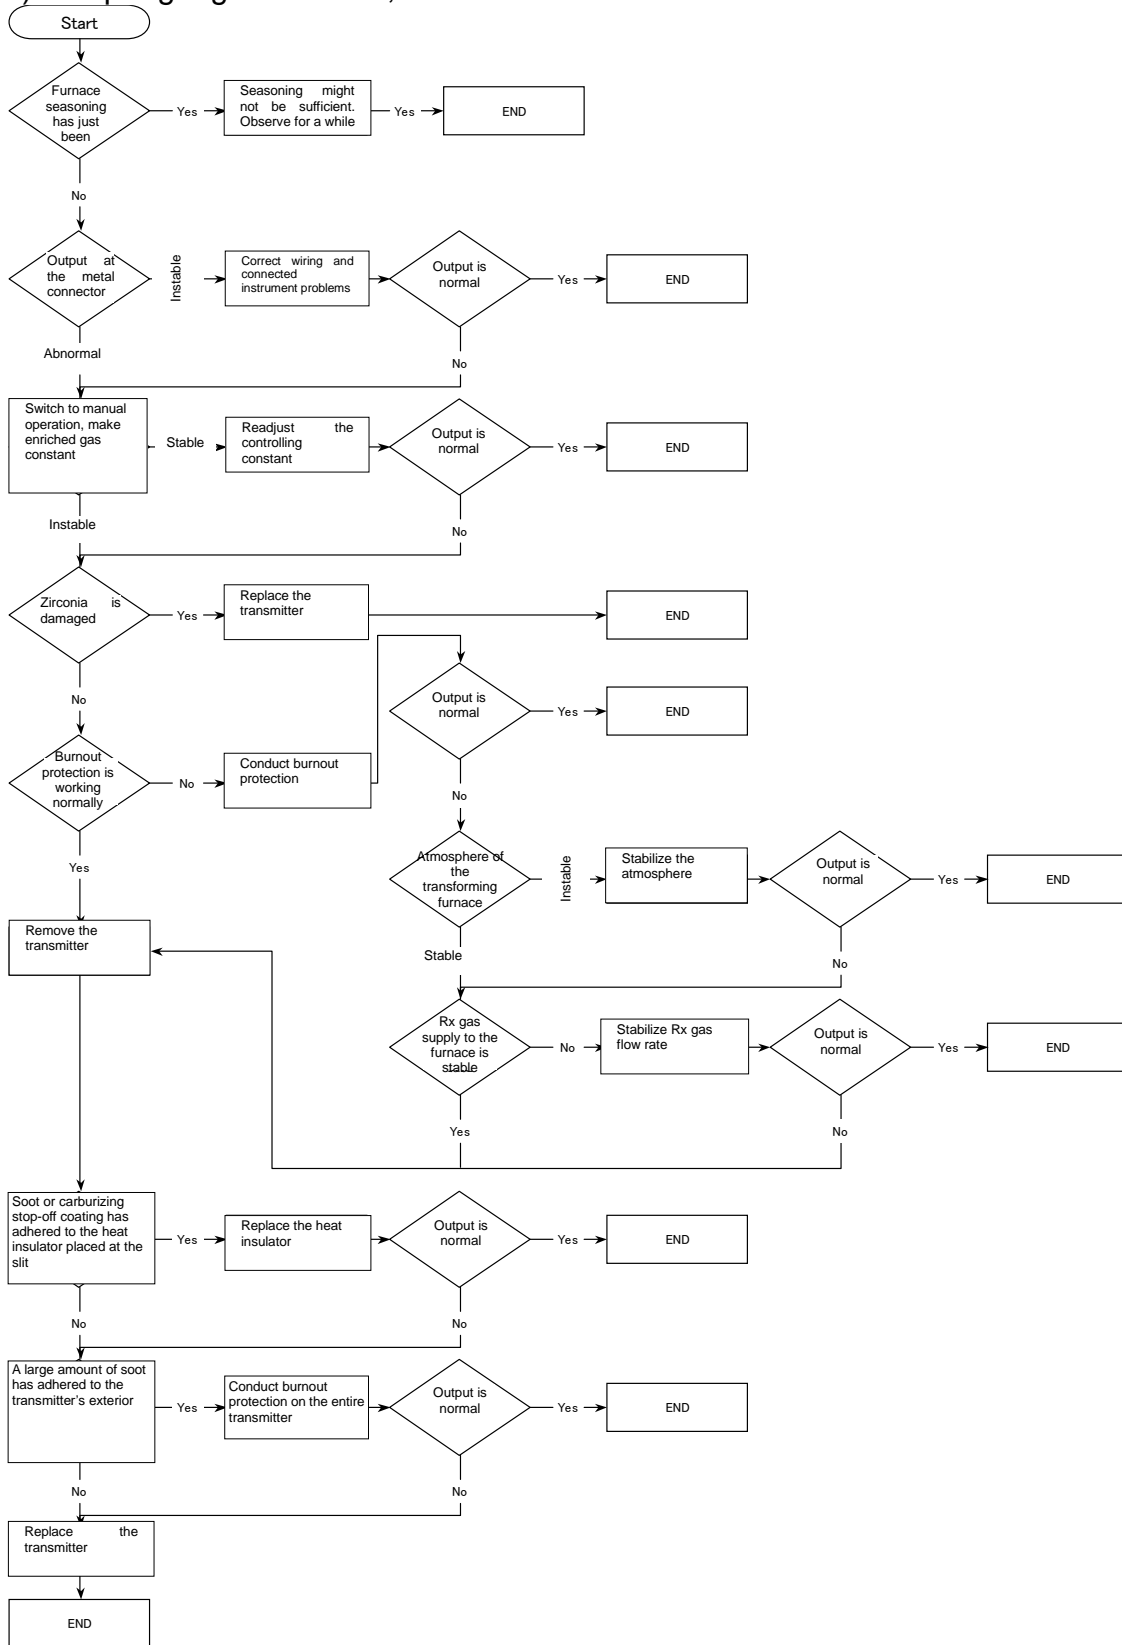

- 1) Output is low; Output does not begin; Start-up is slow; Excessive carburizing occurs; Valve-opening (enriched gas flow rate) exceeds the normal value

2) Output is high; Insufficient carbureting occurs; Valve-opening (enriched gas flow rate) is less than the normal value

3) Output gauge oscillates; Difficult to control

5-4 Suspension of Operation, Long-term Storage of the Product

1. If suspending operation, conduct burnout protection before suspending in order to remove soot adhering to the electrodes.
2. If keeping the product in storage for an extended period of time, follow the instructions below:
 - It is desirable for the product to be stored under the original packaging conditions of the Energy Support Corporation (in a cardboard box, with the probe transmitter in a fixed location).
 - Keep the product indoors, away from rainwater.
 - Keep the product in a location with little change in temperature, with 0-40°C ambient temperature and no more than 85% RH humidity.
 - Keep the product in a low-dust location.
 - Keep the product in a location with little mechanical vibration.
 - Keep the product in a location free from corrosive gases or hazardous gases.
3. When restarting operation, note the following:
 - It is recommended that the probe transmitter be inserted into the furnace with a standard air flow. (If impurities get inside the cell while being stored, a redox status may occur inside the cell, resulting in wear to the electrodes or thermocouples.)
 - Conduct burnout protection when the interior furnace temperature increases, to remove soot adhering to the electrodes.

5-5 About this product

Please download the Safety Data Sheet (SDS) for IsoWool Bulk (artificial mineral fiber) used in this product from our homepage.
